

Response to the master dissertation of Andrey Prudnikov

«Mechanism Design Theory»

In his the dissertation A.Prudnikov considers different examples of the applications of Mechanism Design theory. He makes an overview of existing results and presents one simple modification of GM mechanism.

The dissertation can be considered as survey of the specific part of existing approaches in Mechanism design. The survey is made on a good level, but my opinion is that this is not sufficient for the evaluation of the dissertation as excellent.

The master dissertation prepared at the Saint Petersburg State University as necessary condition for excellent evaluation must contain new results publishable in scientific journals.

The resulting evaluation is GOOD.
